

WE ARE MAKING YOUR HOME
MORE ENERGY-EFFICIENT:
WHAT DOES THAT MEAN?

WHAT WORK DO WE PERFORM?

WE DO DIFFERENT WORK IN EACH HOME, DEPENDING ON WHAT IS NEEDED

We take care of insulation, ventilation, solar panels, and add a (hybrid) heat pump next to the boiler. First, we check what improvements are needed.

1 INSULATING YOUR HOME

What work are we going to do?

For example, we insulate the roof, walls, and floor. We may also replace the glass with HR++ glass.

Why?

This keeps your home warm in the winter. This way, you will save on heating costs and your home becomes more comfortable.

2 IMPROVING VENTILATION

What work are we going to do?

We install a ventilation system that automatically brings fresh air into your home and lets old (polluted) air out of your home.

Why?

Good ventilation is important in a well-insulated house. The ventilation system prevents moisture problems and provides fresh air, making your home healthier to live in.

3 INSTALLATION OF SOLAR PANELS

What do we do?

We install solar panels on your roof, if they are not already there.

Why?

Solar panels generate electricity, so you use less power from the grid. It's also better for the environment.

4 INSTALLATION OF A (HYBRID) HEAT PUMP

What do we do?

We install a heat pump next to your current boiler

Why?

It uses less gas and is better for the environment. The heat pump runs on electricity and mainly uses the power from your solar panels. It is also much more efficient than a gas boiler.

HOW DO WE CHOOSE WHICH HOMES TO FOCUS ON FIRST?

We are making 2400 homes more energy-efficient, but this cannot all be done at once.

We start with homes that have an energy label E, F, or G. These houses use a lot of energy, and the government asks us to improve them. We also look at neighborhoods with high CO2 emissions. To cause less inconvenience, we combine these improvements with planned maintenance.

WHAT CAN HAPPEN WITH MY ENERGY BILL?

With better insulation, ventilation, solar panels, and a (hybrid) heat pump, you should use less energy. How much you save depends on your home, your household, and how you use your home and the systems. Your energy provider affects your costs because prices and payments for sending power back to the grid are different for each provider. Government decisions can also have an impact. For example, the rules for offsetting solar power (salderingsregeling) may change.

We understand that this is not always very clear, we have outlined a few key points.
